

ASSIGNMENT: 15

PROBLEM STATEMENT: Create a serverless computing service.

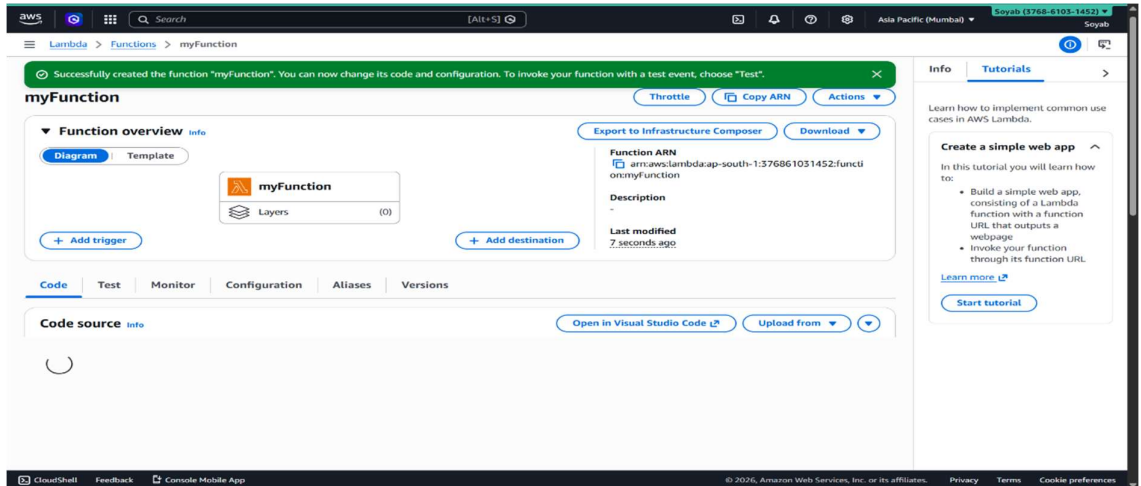

1. Search for 'Lambda' and click on it.

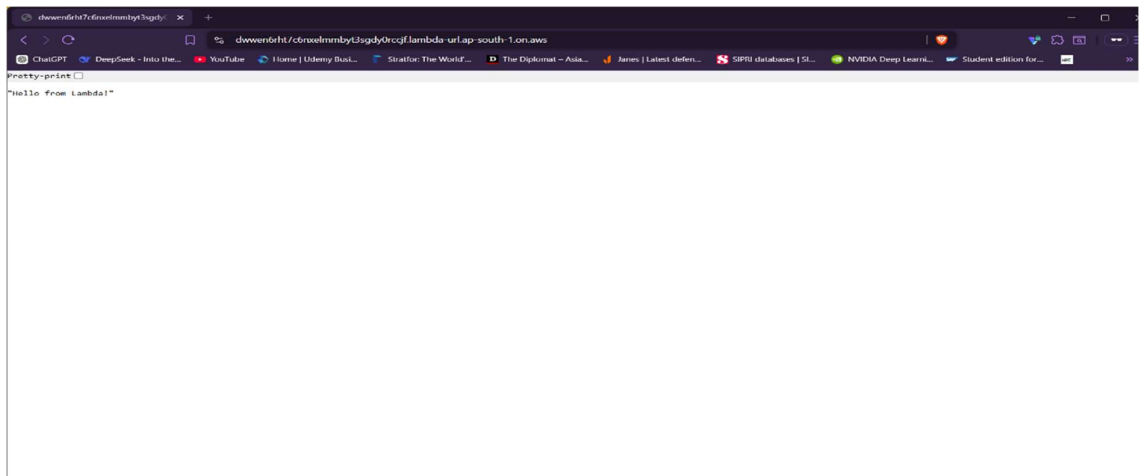

2. Click on 'Create a function' button. Give a name to the function and under runtime select node.js.

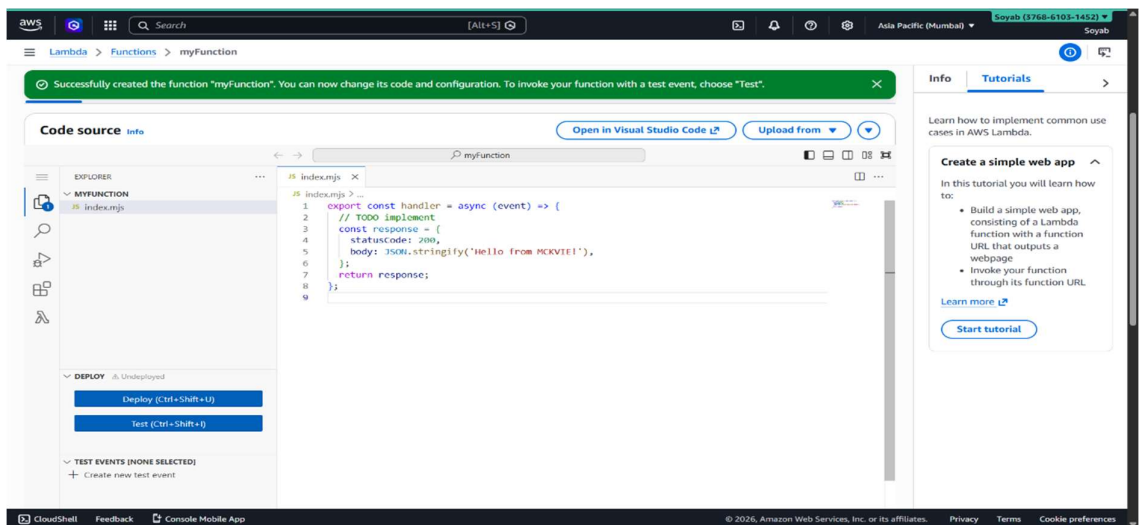

3. The function has been created. Now copy the function URL and paste it on a new tab.

4. The following output should be obtained.

5. Make some changes in the code where you can notice visible change as for me I have change lambda into Soyab. After change click on the deploy button and **Deploy**.

6. Again check the function URL. Paste it on an empty tab and see the visible change.
